Jurni BARE-BONES MVP

The fastest, leanest way to launch Jurni.

A mobile-responsive web app — no maps stack, no native apps, no frills — just the core loop that connects a rider and a driver for a paid trip, plus a live driver-distance bar built on the phone's free GPS.

Mobile-responsive web | No maps SDK | Emergency / SOS | ~5–7 weeks | Jamaican team rates

TIMELINE

~5–7 weeks

~1.5 months to launch

INVESTMENT

JMD 2.5M

≈ US$15,600 · fixed price

RUNNING COST

from ~US$25/mo

no maps-SDK bill

EXECUTIVE SUMMARY

What we're building

A **bare-bones ride-connection web app** that works in any phone browser. A rider requests a ride by choosing a pickup and drop-off **area** (from a list, no map), sees a **recommended fare** from a simple zone table, negotiates if needed, and is matched to an available driver. Once en route, the rider watches a **driver-distance progress bar** that fills as the driver gets closer. Rider and driver **coordinate by phone** and settle in **cash**. For safety, both parties have an **Emergency / SOS** button to call for help or report suspicious activity.

By removing the full maps stack, native apps, wallets, and polished UI — while keeping a lightweight driver-distance bar on the phone's free GPS and a built-in **Emergency / SOS** safety feature — this version launches in **~5–7 weeks** for a fraction of the cost, with **no maps-SDK running costs**. It proves core demand in Kingston before investing further.

HIGHLIGHT FEATURE

The driver-distance bar — without a map

How far is my driver?

The driver phone's **built-in GPS** (the free browser Geolocation API — no maps SDK, no map tiles) sends its position every few seconds. The app computes the **straight-line distance** to the pickup and fills a progress bar as the driver approaches.

Illustrative demo — the bar fills as the driver nears the pickup.

Honest limitation: because it runs in a browser, the driver's position updates only while their Jurni tab is open and on-screen. For the short pickup approach — when the driver is actively using the app — this works well. Robust background tracking would require native apps, which are not part of this MVP.

SCOPE

What's in and what's out

✅ Included in this MVP

- Rider sign-up with **phone OTP** and **basic ID verification**; set an emergency contact
- **Area-based** ride request — pickup & destination from a list (no map)
- **Zone-based recommended fare** with **negotiation**
- **Driver matching** & acceptance; accept / counter the fare
- Driver details shown to rider: **name, vehicle, phone**
- **Driver-distance progress bar** (free browser GPS)
- **Emergency / SOS** — one-tap 911, admin alert with location, activity reporting
- **Cash payment**, simple **ratings**, and **ride history**
- Driver **online/offline** toggle and request list (optional SMS alert)
- **Admin dashboard** — verifications, users, zone-fare config, rides, emergency alerts
- Coverage of **Kingston, St. Andrew & Portmore**; **JMD** throughout

⛔ Excluded from this MVP (with rationale)

EXCLUDED	WHY IT'S FINE FOR THIS MVP
Map display & turn-by-turn navigation	Areas from a list; driver-distance bar via free GPS; coordinate by phone
Distance-based automatic fares	Simple admin zone fare table instead
Native iOS / Android apps	Runs in the mobile browser
Driver wallet & online payments	Cash only in this version
In-app chat	Phone contact only

EXCLUDED	WHY IT'S FINE FOR THIS MVP
Vehicle rentals	Focus on rides first
Advanced / animated UI & push notifications	Clean simple forms + in-app list; optional SMS alerts
Continuous live GPS tracking	Distance bar & SOS use on-demand location capture, not constant tracking

SCOPE

What's included

🧍 Rider

- Sign up + phone OTP; basic ID verification
- Request a ride: pick pickup & destination **area** (no map)
- See recommended fare from the zone table; negotiate
- See driver name, vehicle & phone; coordinate by phone
- **Driver-approach progress bar** (distance only)
- Complete trip, pay cash, rate, view ride history
- **Emergency / SOS** button during a ride

🚗 Driver

- Sign up; upload licence/registration/insurance for approval
- Toggle online/offline
- See requests (in-app list; optional SMS), accept, counter fare
- **Share GPS position while en route**
- See rider contact; mark complete; rate rider
- **Emergency / SOS** button during a ride

🛠️ Admin

- Approve/reject rider & driver verifications
- Manage users
- Configure the **zone fare table** & areas
- View rides & activity
- Receive & acknowledge **emergency alerts** & reports

Areas limited to **Kingston, St. Andrew & Portmore**. **JMD** throughout.

APPROACH

Fares & location without maps

Zones, not a map

Admin defines named areas (Downtown, New Kingston, Half Way Tree, Constant Spring, Papine, Liguanea, Portmore…) and a fare between each pair.

Recommended fare = lookup

The fare for the chosen pickup→destination zones is shown; rider or driver can still negotiate the final amount.

Distance bar, not tracking

Free browser GPS gives a straight-line distance and a filling progress bar — the exact pickup is confirmed by phone.

SAFETY

Emergency & SOS — built in from day one

Safety is included even in the bare-bones version. Both riders and drivers get an **Emergency / SOS** button, prominent during an active ride.

📞 One-tap 911

Instantly dial Jamaica emergency services from the phone — works even if data is down.

🚨 Alert Jurni admin

Sends the user's identity, ride details (driver, rider, vehicle, plate) and their **current GPS location** captured at that moment.

⚠️ Report activity

Flag suspicious/unscrupulous behaviour — harassment, unsafe driving, fare intimidation, route deviation — with notes.

👤 Emergency contact

Set a personal emergency contact at signup or in profile, optionally notified on an SOS.

Bare-bones note: the alert location is the GPS position captured *when SOS is pressed* (browser geolocation), not continuous tracking; the 911 dialer works regardless. All triggers and reports are logged and auditable. Continuous live tracking and a richer emergency dashboard are planned for a future phase. Covers **SOS-1..7** and **ADM-9**.

TECHNICAL APPROACH

Kept deliberately simple

- Single mobile-responsive web app — one codebase for rider, driver & admin; plain clean UI, no animations or advanced components.
- Straightforward backend (e.g. Node/Express) + PostgreSQL — no geospatial extension needed; zones are simple records.
- Matching: available drivers see open requests in their area; first to accept wins.
- Notifications: in-app request list (auto-refresh) + optional SMS to drivers.
- **Driver-distance bar:** driver browser sends GPS every few seconds; backend computes distance (Haversine); rider app polls to update the bar. Free Geolocation API — no maps SDK.
- Verification docs in encrypted object storage; single small cloud server + managed DB; simple CI/CD.

TIMELINE

~5–7 weeks to launch

Week 1

Setup, data model, auth + phone OTP, admin scaffold

Weeks 2–3

Rider request flow, zone fare table, driver acceptance flow

Week 4

Ride completion, ratings, history, verification uploads, **driver-distance bar (GPS + progress bar)**

Week 5

Admin config & approvals, **Emergency/SOS + activity reporting**, full trip end-to-end

Weeks 6–7

QA, fixes, pilot, production launch

INVESTMENT — JAMAICAN TEAM RATES

Effort & cost

JMD primary. Working rate **US$1 ≈ JMD 160** (Aug 2026).

ROLE	RATE (JMD/HR)	HOURS	COST (JMD)
Lead / Full-stack Engineer	5,300	205	1,086,500
Full-stack Engineer (mid)	3,500	190	665,000
UX/UI Designer (basic screens)	3,500	55	192,500
QA Engineer	2,600	68	176,800
Project coordination (part-time)	4,800	55	264,000
DevOps / deployment (light)	4,800	24	115,200
Fixed project price		**597**	**2,500,000**

Fixed project price: JMD 2,500,000 (≈ US$15,600). A single agreed price — inclusive of the driver-distance bar **and the Emergency/SOS safety feature** — not a variable estimate. The role breakdown above is indicative of how the effort is allocated.

Recurring running costs (very low — no maps)

SERVICE	INDICATIVE MONTHLY
Small cloud server + database	US$25 – 80 (JMD ~4k – 13k)
SMS / phone OTP	usage-based (a few JMD per message)
Domain / SSL	negligible
Maps SDK	**JMD 0 — removed in this version**

Payment schedule: 50% on kickoff · 50% on production launch.

FUTURE ENHANCEMENTS

Room to grow (post-MVP)

This MVP is designed to grow, not to be replaced. When demand justifies further investment, the platform can add — on the same backend, without rebuilding the MVP:

1. **Driver wallet & online top-ups** — turn on platform revenue.
2. **Full maps** — live tracking, map-based pickup, turn-by-turn navigation, distance-based fares.
3. **In-app chat** between matched rider and driver.
4. **Vehicle rentals** as a separate product line.
5. **Native iOS + Android apps** for reliable background tracking and app-store presence.

Starting here gives you the **lowest-risk, lowest-cost entry** into the market, with a clear route to the complete product when demand justifies the spend.

GETTING STARTED

Next steps

- Confirm the MVP scope and the initial list of zones + fares.
- Provide brand basics (name, logo, colours) and verification requirements.
- Sign off to kick off the build.

Timeline is indicative; the price is a fixed project price agreed before kickoff.

Jurni

The leanest path to launch — with room to grow into the full product.
